Brian Whitworth completed his psychology Masters thesis on the implications of split-brain research for the concept of "Self". He then became the New Zealand Army Senior Psychologist, then a Defense Computer Systems Analyst, then worked on defense Operational Computing and Simulations. After "retiring" he completed a doctorate on generating computer-mediated agreement. He designed and wrote the groupware used, which sparked an interest in the design and evaluation of "social-technical systems". His publications have appeared in Small Group Research, Group Decision and Negotiation, THE DATABASE for Advances in Information Systems, Communications of the AIS, IEEE Computer, and Behavior and Information Technology (BIT). Topics include generating online agreement, voting before discussing, a cognitive three-process model of online communication, legitimate by design, spam and the social-technical gap, polite computing, and the web of system performance.
